Active Weather Warnings, Watches and Advisories by County:

http://www.wrh.noaa.gov/sto/brief/wwa_bc_cal.php

WEATHER SYNOPSIS BY REGION

NORTHERN CALIFORNIA

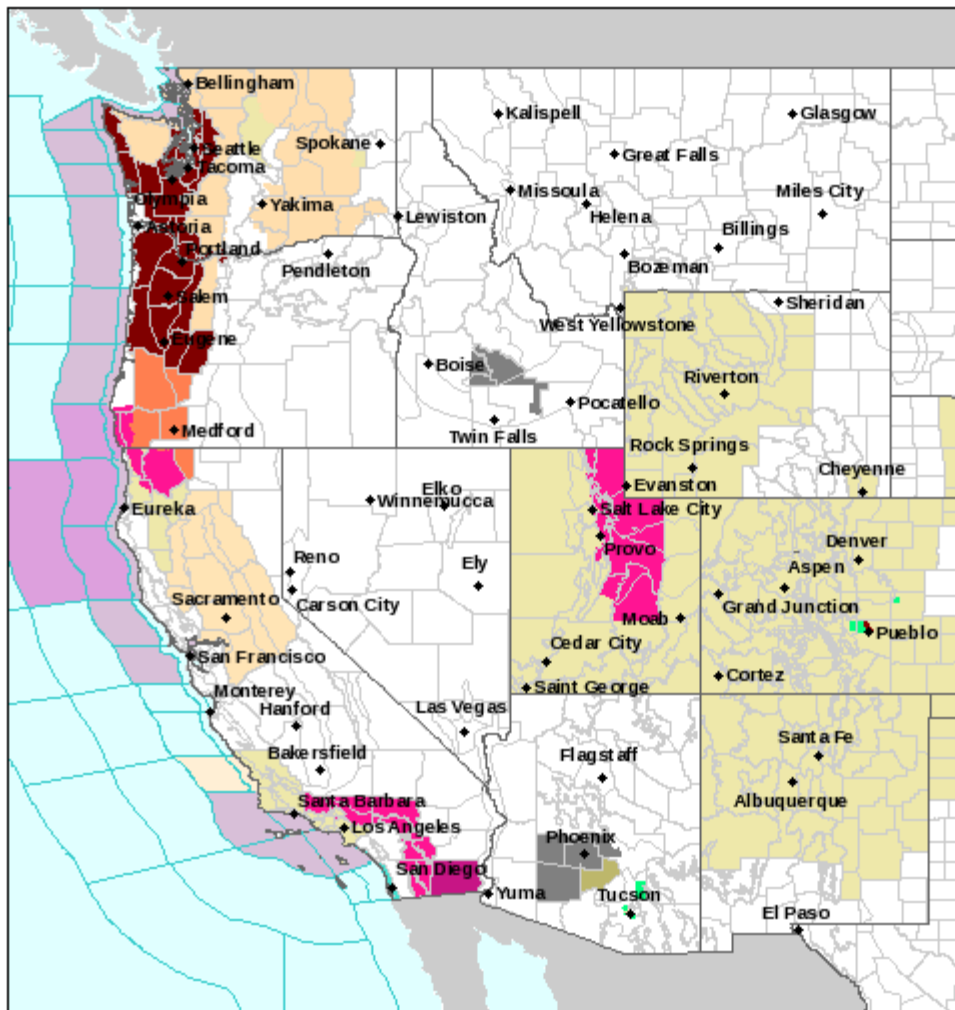

A series of small-scale Pacific low pressure troughs will continue to pass over the region this week, somewhat offsetting the heat produced by a larger-scale high pressure ridge over to our south. Temperatures will still be around 2-5 degrees above normal much of the week. A few cumulus buildups are possible over the northern mountains today, but thunderstorms are unlikely. Isolated thunderstorms are possible over the northern and eastern mountains Tuesday and Wednesday. Any storms that develop will be capable of producing brief rainfall, but dry strikes and new ignitions will also be possible. The low pressure troughs are allowing the marine layer to deepen to 1500-2000 ft. The cool moist marine air will move farther inland with stronger sea breeze winds in the Bay Area and into the Delta, but farther north the surface pressure pattern is producing offshore flow conditions and causing the mid and upper slopes of the mountains of far northwestern California to dry out. Northeast winds in far northwestern California will peak early Wednesday with gusts to near 30 mph. This pattern produces very dry conditions in far northwestern California and fire potential will be elevated for just the mid and upper slopes of the mountains in far northwestern California. A more organized low pressure center is expected to develop near Central California by Thursday and continue through the weekend. This low has the potential to draw in more moist unstable air and produce isolated to scattered showers and thunderstorms over a larger area each afternoon and evening. At this time confidence in the location and amount of thunderstorms is low due to model inconsistency, but it does not appear that it will reach High Risk criteria.

SOUTHERN CALIFORNIA

Onshore flow along with a dry airmass will keep afternoon relative humidity (RH) very low in a few places the next two days. Expect desert-adjacent areas such as the north sides of the Angeles and San Bernardino National Forest and the east side of the Cleveland National Forest to see minimum RH readings fall into the 5-10% range this afternoon. Areas of west winds of 15-25 mph with occasional gusts to 40 mph will be possible in and near the Antelope Valley and the Banning Pass, primarily during the afternoon and evening hours. Elsewhere, local north winds of 10-15 mph will continue in Santa Barbara County early this morning. These winds should decrease by noon, but low RH can be expected above 1,000 feet in Santa Barbara County throughout the day. A weak low pressure area will bring a minor amount of cooling to the region today through Friday. Expect temperatures to trend downward a degree or two each day through the workweek, and by Friday, high temperatures in the valleys will be in the mid 90s. Minimum RH will continue to hover in the 8-12% each afternoon over most inland areas due to a lack of a marine layer. Winds should be lighter Thursday into the weekend with typical sea breezes of 15 mph each afternoon. Strong sunshine will promote enough instability to allow for some cumulus buildups across the mountains each afternoon through the week. One or two thunderstorms may occur in the Sierras Friday and Saturday, but no thunderstorms are expected elsewhere. Most long range models indicate a warming trend next week with temperatures climbing back to over 100 in the valleys by Sunday or Monday.
